

# 22 Modulation Orgy 60

## Quick Reference Guide

Thank you for your purchase, and we appreciate your faith in our products. We try very hard to produce unique tools that help you expand your sonic potential.

You now have one of the most flexible LFOs available. You can change tempo, tempo multiplication, waveform and waveform distortion (slopes) under either manual or voltage control. You can set the tempo manually, with the lighted pushbutton or via the Sync Input. Multiply allows instant changes in convenient factors, making complex syncopation easy. Eight waveforms are available, with slope/width adjustments on all but the random wave. In all, we hope this will be the most fun you've ever had with a LFO.

### Installation

The 2260 is installed like any other Euro style module. Your power supply is connected via the 16 pin polarized ribbon cable (included), and the module is attached to your rack with four Philips drive M3 x 6mm screws (included). Different racks may require a different screw.

The 2260 has a jumper configurable option to allow you to power the +5 volts to the module by either your power supply (if your supply provides this), or internally stepped down from your +15 volt supply as shown below. The 2260 is shipped with this jumper set to Internal (as shown). When changing this jumper or connecting / disconnecting your 2260, please remember to turn off your system's power first.
